

level 2

no. of sessions: 6

cleaning bot

The cleaning bot moves around and helps clean the floor automatically, just like a robot vacuum cleaner at home.

simple machine: wheel & axle

electronic parts: polarity reversal

Motor Driver

The **brain of a robot**. I listen to input devices like sensors and tell output devices like motors/LEDs when to turn ON/OFF.

IR Sensor

I am like a **robot's eyes**. I help robots see objects or follow a path without touching anything.

LDR Sensor

I am like a **light detector** who tells a robot if it is bright or dark and i am used in automatic lights.

Motor

I **change electricity into movement** and help wheels, fans, and robots spin and move.

DPDT Switch Controller

Like a **direction button** - i make a motor spin forward or backward without using coding.

Servo Motor

I am a **smart motor** that can stop at the exact position you want. I am used in robot arms, gates, and moving parts.

Servo Controller

I am like a **control room** for the servo motor and lets you move the servo easily to test how it works.

Battery & Battery Holder

I **give power** to the project, and my battery holder keeps the battery safe and connected. Together, we help the model work.

Jumper Wires

We are the **roads for electricity** who connect the different parts of the circuit, so power can travel.

Motor Clamp

I am like a **strong hand** that holds the motor tightly in place while it spins.

materials needed

M-F beam - x2

M-M beam - x2

F-F beam - x1

L clamp - x2

I clamp - x2

small screw - x8

nut - x8

step 1 : assemble the base

materials needed

F-F beam - x2

M-M beam - x1

L clamp - x2

I clamp - x2

small screw - x8

nut - x8

step 2: attach the supports

materials needed

M-M beam - x1

small screw - x14

nut -

L clamp - x8

M-F beam - x4

step 3: assemble the motor holder

1.

Join 4 X M-F beams
to form a square.

Use L clamps
to hold them together.

2.

Attach another
M-M beam in the
middle using
L clamps as shown.

Add 2x L clamps
to the front of
the square shape
as shown.

materials needed

motor - x1

long screw - x1

nut - x1

step 4: attach the motor

Fix the motor to
the center of the
beam using one
long screw

materials needed

small screw - x2

nut - x2

step 5: attach motor holder to the base

materials needed

motor clamp - x2

small screw - x4

nut - x4

step 6: add the motor clamps

materials needed

motor - x2

long screw - x2

nut - x2

step 7: assemble the back motors

Fix the motors to the clamps using long screw as shown.

materials needed

wheel - x4

long screw - x2

nut - x2

step 8: add the wheels

Add 2 wheels to the **beam in front**, using long screws.

Attach 2 wheels to the **back motor's axle**

materials needed

coupler - x1

I clamp - x4

long screw - x4

nut - x4

step 9: assemble the cleaning blades

Attach **4 x 1 clamps** to the coupler using long screws

Attach the coupler to the axle of the front motor

this cleaning blades help the bot push the dust away

materials needed

motor controller - x1

battery holder x1

battery x1

step 10: circuit
