

# levers: experiment 2

Lift 0.5kg, 1kg, 1.5kg by using a lever and a fulcrum at the center to find out which  uses the most  effort

# observation

measure the effort for each  used:

|                                                                                                                      |  KG |  effort |
|----------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------|
| 1.                                                                                                                   | 0.5kg                                                                                |                                                                                          |
| 2.                                                                                                                   | 1kg                                                                                  |                                                                                          |
| 3.                                                                                                                   | 1.5kg                                                                                |                                                                                          |
| which weight uses the most  effort: |                                                                                      |                                                                                          |

## result

tick the correct answer

heavier

lighter

the **weight**,

more

lesser

the **effort**
